- Provides an easy path from the doctor to the pharmacy to your medicine cabinet
- Tablets can be chewed or swallowed whole

Tyblume[™] 

(levonorgestrel and ethinyl estradiol) tablets,
0.1 mg/0.02 mg

* Price may vary with coverage. See reverse for Important Safety Information, including Boxed Warning. Please visit Tyblume.com for full Prescribing Information.

IMPORTANT SAFETY INFORMATION

INDICATIONS AND USAGE

TYBLUME™ (levonorgestrel and ethinyl estradiol) tablets, 0.1 mg/0.02 mg, is a combination of levonorgestrel, a progestin, and ethinyl estradiol, an estrogen, indicated for females of reproductive potential to prevent pregnancy.

WARNING: CIGARETTE SMOKING AND SERIOUS CARDIOVASCULAR EVENTS

See full prescribing information for complete boxed warning.

Cigarette smoking increases the risk of serious cardiovascular events from combination HORMONAL contraceptive (CHC) use. This risk increases with age, particularly in women over 35 years of age, and with the number of cigarettes smoked. For this reason, CHCs, including TYBLUME (levonorgestrel and ethinyl estradiol) tablets, are contraindicated in women who are over 35 years of age and smoke.

Contraindications

TYBLUME is contraindicated in females with a high risk of arterial and venous thrombotic diseases, current/history of breast cancer or other estrogen-progestin-sensitive cancers, liver tumors (benign or malignant) or liver disease, undiagnosed abnormal uterine bleeding, and in women who use Hepatitis C drug combinations containing ombitasvir/paritaprevir/ritonavir, with or without dasabuvir.

Warnings and Precautions

- Discontinue TYBLUME if a thrombotic event occurs, and at least 4 weeks before and through 2 weeks after major surgery.
- TYBLUME should not be started any earlier than 4 weeks after delivery, in women who are not breastfeeding.
- If jaundice occurs, treatment should be discontinued.
- TYBLUME should not be prescribed for women with uncontrolled hypertension or hypertension with vascular disease.
- Women who are pre-diabetic or diabetic should be monitored while using TYBLUME.
- Alternate contraceptive methods should be considered for women with uncontrolled dyslipidemia.
- Evaluate significant change in headaches and discontinue TYBLUME if indicated
- May cause irregular bleeding or amenorrhea. Evaluate for other causes if symptoms persist.

Adverse Reactions

- Common adverse reactions associated with oral CHCs are headache, abdominal pain, nausea, metrorrhagia, vaginal moniliasis and pain, acne, and vaginitis.
- For serious side effects, see the Boxed Warning, Contraindications, and Warnings and Precautions

Drug Interactions

Drugs or herbal products that induce certain enzymes (for example, CYP3A4) may decrease the effectiveness of TYBLUME or increase breakthrough bleeding. Counsel patients to use a back-up or alternative non-hormonal method of contraception when enzyme inducers are used with TYBLUME and to continue back-up non-hormonal contraception for 28 days after discontinuing the enzyme inducer. Drugs or products that inhibit CYP3A4 may increase TYBLUME systemic exposure.

Use in Specific populations

Pregnancy: Discontinue TYBLUME during pregnancy.

Lactation: Small amounts of oral contraceptive steroids and/or metabolites have been identified in the milk of nursing mothers, and a few adverse effects on the child have been reported, including jaundice and breast enlargement. CHCs can also reduce milk production in breast-feeding females. Advise the nursing female to use other methods of contraception until she discontinues breast-feeding.

Counsel patients that TYBLUME does not protect against HIV-infection (AIDS) and other sexually transmitted infections.

Before prescribing TYBLUME and for complete safety and risk information, please read the full Prescribing Information, including BOXED WARNINGS and Patient Information.
